

A MINUTE OF HEALTH WITH CDC

Staying Ahead of Childhood Diseases

National, State, and Selected Local Area Vaccination Coverage Among Children Aged 19-35 Months---United States, 2013

Recorded: August 26, 2014; posted: August 28, 2014

[Announcer] This program is presented by the Centers for Disease Control and Prevention.

Many childhood diseases that used to cause epidemics in the United States are now rare, thanks to vaccinations. Because of these lifesaving vaccines, more than three quarters of a million deaths will be prevented among children born in the last 20 years. Today's vaccines protect children against 16 diseases, including measles, mumps, rubella, hepatitis A and B, chickenpox, tetanus, and whooping cough, or pertussis. To protect your children from these vaccine-preventable diseases, discuss their vaccine needs with a health care professional at each visit.
